# **A Low Priced Wall Mount Heater May Not Provide Much Heat**

I bought the Soleus HGW308 model electric heater that you could mount to your wall last year. The main reason why I bought this electric heater is because we moved into a house that does not have central heat and air. It also had absolutely no heat anywhere, nothing previously installed.

I have 2 little kids and as everyone knows space heaters usually are not good for kids to be around. So once I saw this [wall mount heater](#) I thought it will be perfect. I could install this high enough on the wall that little hands can't reach it. Well sadly that is the only good thing this type of wall mounted electric heater is good for.

Although my very own children didn't touch the heater and it did look so much better when compared to any unit sitting on the floor, they also didn't get hot enough. The heater doesn't put out sufficient heat to warm a regular sized room. So I went out and purchased 2 of these wall mounted heaters. One for each child's room.

I mounted them on the walls and hoped for the best. Their rooms only got a little warmer when compared to the rooms without heat in them. Even with the doorways closed they had to curl up inside their blankets and the room felt cool. I do not think the room ever reached the set temperature or that the heater ever cut off because it never reached the temperature requested.

So that isn't really Eco friendly, now is it? As expected, I took both wall heaters back to the store. I got the older version that goes on the floor. Even if they are ugly they do work. Not long after I got central heat inside the home. Now my very own house is cozy and toasty during the winter season, with the kids snug safe in their beds. I do not recommend to purchase cheap wall mount heaters for your house, but rather go for prime quality ones.
