An Inexpensive Wall Mount Heater Is Not Going To Produce Much Warmth

I bought the Soleus HGW308 model electrical heater that you could mount to your wall last year. The main reason why I bought this electrical heater is because we moved into a house that does not have central heat and air. It also had absolutely no heat anywhere, nothing previously installed.

I have a couple of kids and as everyone knows space heaters are usually not good for children to be around. So once I spotted this [wall mount heater](#) I thought it will be perfect. I could install this high enough on the wall that little hands couldn't reach it. Well sorry to say that is the only good thing this specific wall mounted electrical heater is good for.

Even though my own kids did not touch the heater and it did look a lot better compared with any unit sitting on the floor, they also did not get warm enough. The heater does not put out enough heat to warm a normal sized room. So I went out and purchased a couple of of these wall mounted heaters. One for each kid's room.

I mounted them on the walls and hoped for the best. Their rooms just got slightly warmer compared with the rooms without heat in them. Even with the doors closed they had to curl up inside their blankets and the room felt cold. I do not think the room ever attained the set temperature or that the heater ever cut off as it never ever attained the temperature requested.

So that is not really Eco friendly, now is it? Needless to say, I took both wall heaters back to the store. I bought the other model that goes on the floor. Even if they're unattractive they do work. Not long after I got central heat inside the home. Now my own home is warm and toasty in the winter time, with the kids snug safe in their beds. I do not recommend to purchase low cost wall mount heaters for your home, but instead go for high quality ones.
